Equipment Method

Method Notes	<p>SPORE TRAPS:</p> <p>It is assumed that you will be using a Bio-Pump to collect air samples using Air-O-Cell or Viacell cassettes. You must include at least one Outdoor Air sample which is a reference control. You may also need to collect another indoor air reference control from an unaffected area depending on the building type. Standard testing is normally 5min @ 75L air.</p> <p>TAPE LIFTS:</p> <p>Apply only once to your target surface.</p> <p>PETRI PLATES:</p> <p>This form can to be used with Petri Plate viable sampling. It is assumed that you are using a standard 90mm diameter Petri Plate and that the plate label shows the media type (PDA, MEA, CHROM, HB, etc). Sampling is generally 2 minutes at 28.3-30L/min.</p>
